Language localisation

From Wikipedia, the free encyclopedia

This article **may require copy-editing for grammar, style, cohesion, tone or spelling**. You can assist by [editing it](#) now. A how-to [guide](#) is available. (November 2008)

This article's [external links](#) **may not follow Wikipedia's content policies or guidelines**. Please [improve this article](#) by removing excessive or inappropriate external links.

Language localisation^[1] (from the English term "locale" and abbreviated in the [numeronym](#) "L10N", the 10 being a way of replacing the middle 10 letters of the word) can be defined as the second phase of a larger process ([Internationalisation](#)) of product translation and cultural adaptation (for specific countries, regions, groups) to account for differences in distinct markets. Thus, it is important not to reduce it to a mere [translation activity](#) because it involves a comprehensive study of the target culture in order to correctly adapt the product.

The localisation process is most generally related to cultural adaptation and translation of [software](#), video games and [websites](#), and less frequently to any written translation (although these also involve cultural adaptation processes). The process of localising can be done for regions or countries where people speak different languages, or where the same language is spoken. Just recall the language differences in countries where Spanish is natively spoken (for instance in South America), or where English is the official language (e.g. in the United States, the United Kingdom and the Philippines).

The overall process: internationalisation, globalisation and localisation

[\[edit\]](#)

As the [LISA association](#) explains, globalization "can best be thought of as a cycle rather than a single process". To *globalise* is to plan in advance the way the product or the website should be designed and developed in order to avoid costs from going up and quality problems from emerging, to save time, and eventually to smooth the localising effort for each region/country. Localisation is one phase, but an integral part, of the overall process called **globalisation**.

In this view, there are two primary technical processes that comprise globalization, **internationalisation** and **localisation**, which make up a double-phase process.

Internationalisation

I012345678901234567N

I 18 N

I18N removes locale-specific code

Localisation

L0123456789N

L 10 N

L10N adds locale-specific versions

I18N/L10N is *mostly* about text

java.util.Locale

- >An identifier that represents a world region
- >Locale(String language)
- >Locale(String language, String country)
- >Locale(String language, String country, String variant)

java.util.ResourceBundle

- >Contains Locale-specific objects, e.g. text
- >Use PropertyResourceBundle or implement your own class

/localisation/java/messages

```
# phrasebook.properties (English)
hello = Hi, a beer please
```

```
# phrasebook_ca.properties (Catalan)
hello = Hola, una cervesa si us plau
```

```
// Get Locale-specific resource bundles, using a country- and language-specific Locale.
```

```
final Locale englishUK = Locale.UK;
final ResourceBundle englishResources = ResourceBundle.getBundle("phrasebook", englishUK);

final Locale catalanSpain = new Locale("ca", "ES");
final ResourceBundle catalanResources = ResourceBundle.getBundle("phrasebook", catalanSpain);

// Hi, a beer please
System.out.println(englishResources.getString("hello"));

// Hola, una cervesa si us plau
System.out.println(catalanResources.getString("hello"));
```

java.util.Properties

>Implements the line-oriented properties file format

java.text.MessageFormat

>Provides language-neutral construction of text with placeholders

java.text.ChoiceFormat

>Is a NumberFormat that formats number ranges as text

>e.g. format '42' as '42' or 'The answer to life, the...'

/localisation/java/java.util.Properties

```
# Properties file, as parsed by java.util.Properties.load(Reader)

! Comments have a hash or exclamation mark as the first non-white space; blank lines are ignored

# It is conventional, but not required, to use dots to organise keys
key.1=value one

# In keys, leading and trailing white space is ignored
key.2 = value two

# The separator may also be a colon
key.3 : value three
key.4:value four

# You can use either separator in the key if you escape it.
key\with\separators.5 = value five

# If there is only a key, the value is the empty string ""
key.6

# Long lines may be broken with a backslash; leading white space on the next line is ignored
first.hundred = 3141592653589793238462643383279502884197169399375105820974944592307816406286\
208998628034825342117067
```

/localisation/java/java.text.MessageFormat

```
value/plain = Beer please  
# {0} is a plain placeholder that specifies a parameter index  
# {0} (String) name of a beer  
value.MessageFormat.none = A bottle of {0} please  
  
# {1,number} is a placeholder that specifies the MessageFormat 'number' format type  
# {1} (Number) the number of bottles required  
value.MessageFormat.number = {1,number} bottles of {0} please  
  
# {1,choice,formatStyle} specifies a ChoiceFormat for {1} (Number)  
value.MessageFormat.choice = \  
    {1,choice,1#One bottle please|1<{1,number} bottles please|6<Just keep them coming}  
  
# ... which is formatted as (for numbers 1, 2, 10):  
# One bottle please  
# 2 bottles please  
# Just keep them coming  
  
# {2,time,short} specifies the 'time' format type and the 'short' format style  
# {2} (Date) when happy hour starts  
value.MessageFormat.time = Happy hour starts at {2,time,short}  
  
# {3} (Date) when happy hour starts  
value.MessageFormat.date = There is live music on {3,date,full}
```

- # String behaviour depends on Locale and char
 - > "塗".length() == 2 // Unicode code point > \uFFFF
 - > String.toUpperCase(Locale) needed for i18n, e.g.
"i".toUpperCase(new Locale("tr")).equals("İ") // Dotted I
 - "I".toLowerCase(new Locale("tr")).equals("ı") // Dotless i
- # JDK classes are not localised in all languages
 - > TimeZone, date formats, number formats, Locale
 - > Use SPIs to plug-in your own localisations
- # Use a java.text.Collator for sorting

Properties files use ISO-8859-1 encoding

- >Use Unicode escapes, e.g \u00e9
- >UTF-8 encoding supported in Java 1.6

Use a tool to generate non-English files

- >native2ascii generates Unicode escapes
- >Write your own tool

JDK MessageFormat API documentation humour:

- > 'The rules for using quotes within message format patterns unfortunately have shown to be somewhat confusing. In particular, it isn't always obvious to localizers whether single quotes need to be doubled or not. Make sure to inform localizers about the rules, and tell them (for example, by using comments in resource bundle source files) which strings will be processed by MessageFormat'
- > We just use 'curly' quotes instead of 'single' quotes

javax.servlet.ServletRequest.getLocale()

- >The Servlet API constructs a Locale object from the Accept-Language HTTP headers in an HTTP request.
 - >Users can set language preferences in the web browser or operating system
- ... but sometimes do not, in which case you add a language preference to your web application.

Localisation API has not changed for years

The basic functionality works well

>... even if it isn't pretty

Beware of the details:

>many APIs are Locale-dependent

>message file text encoding

>MessageFormat syntax rules

Seam 'locale' component

- >java.util.Locale instance
- >Set from HTTP request, faces-config.xml or default
- >Set programmatically using 'localeSelector'

Seam 'messages' component

- >Seam resource bundle loads from multiple bundles
- >'messages' component provides Map interface to resources

/localisation/seam/configuration

```
<!-- faces-config.xml - JSF configuration -->
<faces-config>
  <application>
    <message-bundle>messages</message-bundle>
    <!-- Configure Locales that will be available to Seam's localeSelector --->
    <locale-config>
      <default-locale>en</default-locale>
      <supported-locale>en</supported-locale>
      <supported-locale>fr</supported-locale>
    </locale-config>
    <!-- ... --->
  </application>
</faces-config>
```

```
<!-- components.xml - Seam components configuration -->
<core:resource-loader>
  <core:bundle-names>
    <!-- Note that Seam can combine multiple properties files in its single resource bundle -->
    <value>api</value>
    <value>external</value>
    <value>messages</value>
    <value>ui</value>
  </core:bundle-names>
</core:resource-loader>
```

/localisation/seam/org/jboss/seam/international/Messages.java

```

            {
                return null;
            }
        }
    };
}
```

/localisation/seam/facelets

```
# messages.properties - Java properties file, localised text for messages used in Java classes.  
orders = Orders  
command.orders.edit = Edit order details
```

```
# messages_fr - French localisation  
orders = Commandes  
# \u00C9 'E' with acute accent  
# \u00E9 'e' with acute accent  
command.orders.edit = \u00C9diter les d\u00E9tails de la commande
```

```
<!-- facelets-view.xhtml -->  
  
<!-- The messages component has a java.util.Map interface, so you can deference by dot -->  
<h1>#{messages.orders}</h1>  
  
<!-- Wrong! Causes javax.el.ELException: /facelets-view.xhtml:  
     Property 'orders' not found on type java.lang.String -->  
<h2>#{messages.command.orders.edit}</h2>  
  
<!-- Right! Message key that contains dots -->  
<h2>#{messages['command.orders.edit']}
```

Using MessageFormat in attribute values

>Problem: JSF only provides an h:outputFormat tag

Using JSF converters

>Problem: MessageFormat does not work with converters

JSF components embedded in messages

>Problem: you can interpolate a String, not a Component

/localisation/seam/facelets/placeholders in messages

```
# messages.properties (English) - message containing a placeholder  
# {0} is the user name  
notify.user = Notify {0}  
  
# messages.properties (Dutch)  
notify.user = {0} attenderen
```

```
<!-- Format the message using placeholders -->  
<h:outputFormat value="#{messages['notify.user']}">  
    <f:param value="#{user.name}" />  
</h:outputFormat>  
  
<!-- Problem: we cannot use h:outputFormat to format an attribute value. -->  
<h:commandLink action="#{action.notify}" value="Notify Peter"/>  
  
<!-- Too verbose to be a solution - put the value as the tag body: -->  
<h:commandLink action="#{action.notify}">  
    <h:outputFormat value="#{messages['notify.user']}">  
        <f:param value="#{user.name}" />  
    </h:outputFormat>  
</h:commandLink>  
  
<!-- Solution: an Expression Language function that does message look-up. -->  
<h:commandLink action="#{action.notify}" value="#{eg:message('user.notify', user.name)}"/>  
  
<!-- Alternative solution: use the 'interpolator' component -->  
#{interpolator.interpolate(messages['user.notify'], user.name)}
```

/localisation/facelets/defining a facelets tag library function

```
<?xml version="1.0" encoding="UTF-8"?>

<!-- Option 1: vote (and wait) for JSF 2.0 specification issue 517:

https://javaserverfaces-spec-public.dev.java.net/issues/show_bug.cgi?id=517 -->

<!-- Option 2: implement a custom JSF component whose tag supports nested facets,
to replace h:outputFormat -->

```
<eg:componentMessage key="items.showRelated">
  <f:facet name="link">
    <!-- Don't forget that a f:facet may only have one immediate child JSF component -->
    <h:commandLink action="#{action.showRelated()}">
      #{messages['items.showRelated.link']}
    </h:commandLink>
  </f:facet>
</eg:componentMessage>
```

{link} the link text

items.showRelated = See the {link}.

items.showRelated.link = related items

- # Seam Locale/ResourceBundle support is good
- # MessageFormat deserves JSP's fate
- # JSF-oriented MessageFormat replacement needed

Translators are not programmers

- > You could try explaining properties files, Unicode escapes, ISO-8859-1 encoding, version control, and MessageFormat's quote syntax.
- > Good luck with that

You need a collaboration tool

- > Parse and generate Java properties files
- > Multi-user versioning and collaboration features

Translators want a spreadsheet user-interface

Wikis have transformed online collaboration

- >enable updates from many people
- >versioning and public edit history
- >discussion and comments in-line
- >no excuse for sending unversioned files by e-mail

We obviously need another Seam application...
